"Genetic variability of hepartitis C virus in Western Siberia.";
"Genetic variability of hepartitis C virus in Mestern Siberia.";
Submitted (APR-2002) to the EMBL/GenBank/DDBJ databases.
-!- SUBGNIT: THE VIRION OF THIS VIRUS IS A NUCLECCAPSID COVERED BY
LIPOPROTEIN MAND GLYCOPROTEIN E. THE NUCLECCAPSID IS A COMPLEX OF
PROTEIN C AND MRNA (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Viruses; ssRNA positive-strand viruses, no DNA stage; Flaviviridae;

"A novel hepatitis C virus (HCV) subtype from Somalia and its
classification in HCV clade 3.";
J. Gen. Virol. 81:1485-1493(2000)
-1- SUBGNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A
LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF
PROTEIN C AND MRNA (BY SIMILARITY).

Submitted (MAR-1995) to the EMBL/GenBank/DDEJ databases.
Submitted Submitted of THIS VIRUS IS A NUCLECCAPSID COVERED BY LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GEXCOPROTEIN B. THE NUCLECCAPSID IS A COMPLEX OF PROTEIN C AND MRNA (BY SIMILARITY).

Sequence 32, Application US/08921887

Patent No. 603071

GENERAL INFORMATION:
APPLICANT: KHUDYAKOV, YURI E.
APPLICANT: FIELDS, HOWARD A.
TITLE OF INVENTION: MOSAIC PROTEIN AND RESTRICTION
TITLE OF INVENTION: ENDONUCLEASE ASSISTED LIGATION METHOD FOR MAKING THE SAM NUMBER OF SEQUENCES: 55
CORRESPONDENCE ADDRESS:
ADDRESSEE: JONES & ASKEW, LLP Sequence 3, Appli Sequence 26, Appli Sequence 9, Appli Sequence 23, Appli Sequence 3, Appli Sequence 10, Appli Sequence 14, Appl Sequence 8, Appli Sequence 8, Appli Sequence 8, Appli Sequence 8, Appli Sequence 2, Appli Sequence 2, Appli 60, Appl 1, Appli 2, Appli Sequence 10, Appl Sequence 198, App Sequence 232, App Gaps Sequence 46, Sequence 60, Sequence ö Length 28 Indels COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFWARE: PatentIn Release #1.0, Version #1.30
APPLICATION NUMBER: US/08/921,887 ADDRESSEE: JONES & ASKEW, LLP STREET: 191 Peachtree Street, N.W., 37th Floor CITY: Atlanta 100.0%; Score 149; DB 3; 100.0%; Pred. No. 3.3e~15; tive 0; Mismatches 0; US-08-530-550-3 US-08-262-037-26 PCT-US94-07088-9 PCT-US94-07088-9 US-08-836-075A-10 US-08-835-86C-198 US-08-835-86C-232 US-08-835-86C-232 US-08-835-86C-232 US-08-344-616-8 US-08-344-616-8 US-08-344-616-8 US-08-34-977-8 US-08-36-075A-46 US-08-836-075A-46 US-08-836-075A-46 US-08-836-075A-60 US-08-836-075A-60 ALIGNMENTS ATTORNEY/AGENT INFORMATION:
NAME: WARREN, WILLIAM L.
REGISTRATION NUMBER: 36,714

                                 The invention relates to a mosaic protein, comprising a plurality of homologous antigenic peptides from different genotypes of a species. The antigenic peptides are from nucleocapsid (NC) proteins. A method for synthesising an artificial gene that encodes the mosaic protein is also provided. The method is designated restriction endonuclease assisted are useful for detecting a hepatitis infection in an individual. The mosaic gene and protein is also useful for vaccination against infection, especially hepatitis C. The method of synthesizing the artificial gene and the resulting mosaic protein improve the sensitivity, spectrum of immunoreactivity, and antigen specificity of enzyme immunoassays. This provides improved detection of hepatitis C virus.
                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               envelope 1; core protein; HCV genotyping; antibody; vaccine;

Isolated cDNA sequences are used for the prodn. of primers useful for detecting the presence of HCV in a sample, the primers are also useful for HCV genotyping. Proteins encoded by the cDNAs can be used in vaccines for immunising against HCV infection. The proteins may also be used to detect antibodies against HCV in serum, sellva, lymphocytes or other mononuclear cells. The antibodies may be used in the prevention of HCV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                DNA and amino acid sequence of HCV envelope 1 and core proteins -used to determine HCV genotype and as vaccines against HCV infection

```

```
This sequence is encoded by the oligonucleotide, CN14, and represents the peptide fragment CP14. CP14 is a fragment of the core region of hepatitis C virus (HCV). CP14 may be used in the detection of HCV infection and to raise antibodies against it.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

```

capsid non-A,

```
Hepatitis C virus (HCV) amino acid sequence. They represent the beginning of the HCV open reading frame to amino acid 38 and encompass the "common" sequence. These peptides are contained in the capsid protein of the virus and themselves contain epitope groups. These peptides can be used in immunoassays for HCV antibodies in the diagnosis of non-A, non-B hepatitis (NANBH), and in competitive inhibition assay for detecting HCV specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Hepatitis C virus; HCV; open reading frame; "common" sequence; capsid protein; epitope; immunoassay; antibody; diagnosis; NANBH; non-A, non-B hepatitis; competitive; inhibition assay.
                                                                                                                        Synthetic peptide epitope with sequence encoded by hepatitis-C virus - for immunoassay for antigens for diagnosis of non-A,

They represent the beginning of the HCV open reading frame to amino acid 38 and encompass the "common" sequence. These peptides are contained in the capsid protein of the virus and themselves contain epitope groups. These peptides can be used in immunoasasys for HCV antibodies in the diagnosis of non-A, non-B hepatitis (NANBH), and in competitive inhibition assay for detecting HCV specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Hepatitis C virus; HCV; open reading frame; "common" sequence; capsid protein; epitope; immunoassay; antibody; diagnosis; NANBH; non-A, non-B hepatitis; competitive; inhibition assay.

The present sequence represents a Hepatitis C virus (HCV) protein sequence from the disclosure of the present specification. The present specification describes a chimeric HCV peptide antigno which comprises at least 2 peptide epitope regions from the HCV polypeptide core region, 2 peptide epitope regions from the NS3 region and at least 2 peptide epitope regions from the NS3 region and at least 2 peptide epitope regions from the NS4 region. The antignen binds specifically with an antibody produced by a human infected by HCV. The peptide can detect a wide range of HCV infections with high sensitivity.
                                                                                                                                                                                                                                                                                                                                                                                                         New chimeric peptide antigen derived from hepatitis C virus protein - useful for detecting HCV infections

The sequences given in AAR30665-89 represent fragments of the Hepatitis C virus (HCV) amino acid sequence. They represent the beginning of the HCV open reading frame to amino acid 38 and encompass the "cormon" sequence. These peptides are contained in the capsid protein of the virus and themselves contained in the capsid protein of the virus and themselves contain epitope antibodies in the diagnosis of non-A, non-B hepatitis (NANBH), and in competitive inhibition assay for detecting HCV specific
                                                                                                                                                                                                                                      ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                       The invention relates to a peptide, which is recognised by antibodies against amino acids 2.45 at the N-terminus of the core (or nucleocapsid) p21 protein of hepatitis C virus (HCV), or its variants. The peptide has a tertiary structure consisting of two alpha-helical fragments, almost perpendicular to each other in space, connected by a junction peptide. Excluded are all proteins and peptides comprising, or consisting of, the N-terminal part of p21 (starting from amino acid 1 or 2). Also new are (1) monoclonal or polyclonal antibodies produced using the peptide as an immunogen and (2) complex consisting of the peptide specifically bound to some other molecule, particularly peptide or nucleotide fragments or functionalised aromatic compounds. The peptide is used (1) as immunogen for generating antibodies and (11) for detecting and quantifying either antibodies against p21 or HCV-derlyed mRNA (by
                                                                                                                                                                                                                                                                                                                                                                                prevent HCV infections. The present sequence represents the N-terminus the core p21 protein of hepatitis C virus.

It is an immunodominant region containing conformational type epitopes and linear type epitopes. It manifests an immunoractivity with all the sera of individuals or blood samples infected with HCV and which possess antibodies directed against the core protein. An amino acid may be substituted for homologous amino acids and side chains and peptide bonds may be modified. For example, L-amino acids may be replaced by D-amino acids, amine groups may be acetytated, and so on. The native antigenic sequence and its antigenic derivatives may be used for detection of hepatitis C virus and for raising antibodies against the virus.
                                                                                   nsed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Polypeptides that bind to anti-hepatitis C virus antibodies, useful for diagnosing and preventing hepatitis C infections -
                                                   Peptides AAY26949-Y26955 represent peptide epitopes derived from the N-terminus of the hepatitis C virus core protein. The peptides are used to generate monoclonal antibodies or antibody fragments specific for hepatitis C virus (HCV) core protein. The monoclonal antibodies are used for early diagnosis of HCV infections, especially by two-antibody
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; hepatitis C virus; HCV; immunogen; antigen; antibody; virucide; hepatotropic; anti-inflammatory; virus detection; vaccine.

The sequences given in AAR25929-30 and AAR29534-42 represent various clones of the polypeptide core-envelope region of the Hepatitis C Virus (HCV) gene of the invention. These sequences were isolated from the serum of a patient suffering from hepatitis C (HC). The RNA sequences encoding these peptides were converted into cDNA using transcriptase in the presence of one of the primer sequences given in AAQ35540-46. The cDNA sequences isolated represent different alleles of the same region of the HCV gene. The entire HCV protein (see AAR29527) is useful in the development of a diagnostic method which is more accurate and effective than conventional ones, in the detection of antibodies raised against a wide range of HCVs which have been hardly detected before. The complete gene may be used in can in vitro screening system for a substance capable of specifically supressing or controlling a proteolytic processing of a precursor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Clone; polypeptide; core-envelope; region; Hepatitis C; Virus; HCV; HC; cDNA; transcriptase; primer; allele; diagnostic; antibody;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New hepatitis C virus gene and its encoded protein – used for diagnosing and vaccinating against hepatitis C virus infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Length 55;
                  Clone, polypeptide, core-envelope, region, Hepatitis HC; cDNA, transcriptase, primer; allele; diagnostic, supress; control; proteolytic processing; precursor.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is the 45 N-terminal amino acids of the core protein of the human hepatitis C virus (HCV). The sequence is an immunodominant region containing conformational type epitopes and linear type epitopes. It manifests an immunoreactivity with all the sera of individuals or blood samples infected with HCV and which possess antibodies directed against the core protein. An amino acid of the present sequence may be substituted for homologous amino acids and side chains and peptide bonds may be modified. For example, L-amino acids may be replaced by D-amino acids, amine groups may be acetylated, and so on. The present antigenic sequence and its antigenic derivatives may be used for detection of hepatitis C virus and for raising antibodies against

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The sequences given in AAR25929-30 and AAR29534-42 represent various clones of the polypeptide core-envelope region of the Hepatitis C clones of the polypeptide core-envelope region of the Hepatitis C virus (HCV) gene of the invention. These sequences were isolated from the serum of a patient suffering from hepatitis C (HC). The RNA sequences encoding these peptides were converted into cDNA using transcriptase in the presence of one of the primer sequences given in AAQ32540-46. The cDNA sequences isolated represent different alleles of the same region of the HCV gene. The entire HCV protein (see AAR29527) is useful in the development of a diagnostic method which is more accurate and effective than conventional ones, in the detection of antibodies raised against a wide range of HCVs which have been hardly detected before. The complete gene may be used in an in vitro screening system for a substance capable of specifically substance controlling a proteolytic processing of a precursor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Clone; polypeptide; core-envelope; region; Hepatitis C; Virus; HCV; HC; cDNA; transcriptase; primer; allele; diagnostic; antibody; supress; control; proteolytic processing; precursor.

The sequences given in AAR25929-30 and AAR29534-42 represent various clones of the polypeptide core-envelope region of the Hepatitis C clones of the polypeptide core-envelope region of the Hepatitis C virus (HCV) gene of the invention. These sequences were isolated from the serum of a patient suffering from hepatitis C (HC). The RNA caquences encoding these peptides were converted into CDNA using transcriptase in the presence of one of the primer sequences given in AAQ32540-46. The CDNA sequences isolated represent different in AAQ32507. Is useful in the development of a diagnostic method which is more accurate and effective than conventional ones, in the detection of antibodies raised against a wide range of HCVs which hardly detected before. The complete gene may be used in an in vitro screening system for a substance capable of specifically superssing or controlling a proteolytic processing of a precursor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New hepatitis C virus gene and its encoded protein – used for diagnosing and vaccinating against hepatitis C virus infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Honda Y, Murakami T, Seki M, Takahashi K;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       polyprotein - polyprotein -

A) Reference houser, J.T.
Submitted to the EMBL Data Library, January 1994
A) Description: Analysis of hepatitis C virus genotypes 1 to 5 by LiPA.
A) Reference number: S41341
A) Reference number: S41341
A) Recession: S4136
A) Rolecule type: genomic RNA
A) Residues: 1-114 </P>
A) Residues: 1-114 </P>
A) Reperimental source: genotype 5, N2
C) Superfamily: hepatitis C virus genome polyprotein
C) Superfamily: hepatitis C virus genome polyprotein
C) Reproduct: core protein; polyprotein
F):1-114/Product: core protein #status predicted

Genomic characterization and mutation rate of hepatitis C virus
isolated from a patient who contracted hepatitis during an epidemic
of non-A, non-B hepatitis in Japan.";
J. Gen. Virol. 73:2725-2729(1992).
I- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A
LIPOPMOTEIN ENVELOPE. THE ENVELOPE CONSIGTS OF TWO PROTEINS:
PROTEIN AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF
PROTEIN C AND MNNA.

-i- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE HYDOPHOBIC. SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION. NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.

-i- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY LIPOPROTEIN ENVELOPE CONSIGNS OF TWO PROTEIN BY PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MANA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Hepatitis C virus (isolate HC-J5) (HCV).

SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY LIPOPROTEIN ENVELOPE. THE SENVELOPE CONSISTS OF TWO PROTEINS: E1 AND E2. THE NUCLEOCAPSID IS A COMPLEX OF PROCIFIN C AND MRNA. PTM: THE STRUCTURAL PROTEINS C, E1 AND E2 ARE PRODUCED BY PROTEOLYTIC PROCESSING BY THE HOST SIGNAL PEPTIDASES. SIMILARITY: THE NS2 PROTEASE BELONGS TO PEPTIDASE FAMILY UJ9. SIMILARITY: THE NS3 PROTEASE BELONGS TO PEPTIDASE FAMILY UJ9.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SIMILARITY).

Mucleotide sequence of the genomic RNA of hepatitis C virus isolated from a human carriter: comparison with reported isolates for conserved and divergent regions ";

J. Gen. Virol. 72:2697-2704(1991).

J. Gen. Virol. 72:2697-2704(1991).

HYDROPHOBIC, SUGGESTING NS2A, NS2B, NS4A AND NS4B ARE FUNCTION: THE SMALL PROPEIRS OF FOUR PRELICATION.

HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.

NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.

C. I. CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Gil in the P6

POSSITION. Cys or Thr in Pl and Ser or Ala in Pl'.

C. I. CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +

28-FEB-2003 (Rel. 41, Last annotation update)
Genome polyprotein [Contains: Capsid protein C (Core protein) (P22);
Envelope glycoprotein E1 (GP32) (GP35); Envelope glycoprotein E2 (GP68) (GP70) (NS1); Protein P7: Nonstructural protein NS2 (P21) (EC 3.4.22.-); Protease/helicase NS3 (P70) (Hepacivirin)
(EC 3.4.21.98); Nonstructural protein NS48 (P57); Nonstructural protein NS58 (P27); Nonstructural protein NS58 (P57); Nonstructural protein NS58 (P50); Nonstructural protein Hepatitis C virus (isolate HC-38) (HCV).
                                                                                                                                                                                                                                                                                                                                                                                                                 MEDLINE-92230232; PubMed-1314459; Okamoto H., Lizuka H., Tanaka T., Okamoto H., Kurai K., Okada S.-I., Yamamoto K., Lizuka H., Tanaka T., Fukuda S., Tsuda F., Mishiro S.; **Full-length sequence of a hepatitis C virus genome having poor pomonology to reported isolates: comparative study of four distinct genotypes.";
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  VITOLOGY 188:331-341(1992).

-I- FUNCTION: THE SMALL PROTEINS NSZA, NSZB, NS4A AND NS4B ARE HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.

HYDROPHOBIC, SUGGESTING A ROLE IN THE VIRAL RNA REPLICATION.

-I- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in Pl and Ser or Ala in Pl'.

-I- CATALYTIC ACTIVITY: N nucleoside triphosphate - N diphosphate + (RNA)(N).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                InterPro; IPR002518; HCV_NS2.

                                    -I-FUNCTION: THE SMALL PROTEINS NS2B, NS4B AND NS4B ARE HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.
NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
-I-CATALYTIC ACTIVITY: HYDROLYSIS OF four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in P1 and Ser or Ala in P1'.
-I-CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate + (RNA)(N).
-I-SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE CONSISTS OF TWO PROTEINS: PROTEIN MND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
-I-SIMILARITY: THE PROTEASE BELONGS TO PEPTIDASE FAMILY S29.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CELLULAR AMINOPERIDAGE.

SUBURIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
